

Broadband via multimode fiber

Overview

This guide explains the five generations of multimode fiber - OM1, OM2, OM3, OM4, and OM5 - covering their physical characteristics, color coding, bandwidth, maximum distances at different data rates, optical sources (LED, VCSEL, SWDM), and real-world applications in. Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. To recap Optical Fiber can be divided into Multimode Fiber (MMF) and Single-Mode optical fiber (SMF). Multimode Fiber (MMF) has a core diameter, typically 50-100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at. It is widely used in local area networks, data centers, and other applications where high-bandwidth connectivity is required.
