

# Core Switch ESD Cable

## Overview

---

These fully integrated connectors and adapters provide protection from Electro Static Discharge (ESD) and Electronically Fast Transients (EFT) that can damage or even destroy your equipment. The connectors are designed to meet various IEC 61000-4-21, EN 61000-4-2 and IEC 61000-4. While we've all experienced ESD when we've been shocked by a metal doorknob or car door, most ESD strikes are quite harmless to. Electrostatic Discharge (ESD) is the sudden and momentary release of electric current that results from a voltage difference between two physically connected points. Power over Ethernet (POE) applications enable standard Ethernet cables to carry both data and power to remote devices, greatly simplifying the networked system. POE reduces the number of cables needed to connect networked devices and enables systems to access locations where power is not readily. Smart FilteringAs you select one or more parametric filters below, Smart Filtering will instantly disable any unselected values that would cause no results to be found. Focusing on efficiency, Nexperia produces semiconductor components at high volume, around 100 billion annually.

## Core Switch ESD Cable
