

# **DC row head cabinet output voltage**

## Overview

---

DC output voltages include 24V, 48V, 125V, or 240V, and power capacities range from 2.6kW to 20kW in DC power plus battery configurations and up to 125kW in battery-separate versions. The DGX SuperPOD is typically deployed with a rack density of four DGX H100 systems per rack, although deployments with lower rack densities are possible. Combining international norms on voltages and circuit protection yields common power provisioning patterns for data centers. Note: the new version of the National Electrical Code (NFPA 70 [4]), which will be released in 2017, will define medium voltage as 600 to 1000V. This table is an example of the voltages used to test the resistance and current leakages for different circuits. Array cabinets can be classified based on their installation location into head cabinets, middle cabinets, and tail cabinets, and are distinguished further as either high-voltage array cabinets or low-voltage array cabinets.
