

Data Processing Process of Optical Module

Overview

Optical modules convert electrical signals into light to move data quickly and reliably in AI systems, enabling fast and smooth data processing. The relentless surge of Artificial Intelligence (AI), encompassing everything from large language models like ChatGPT to real-time computer vision and autonomous systems, is fundamentally reshaping industries. Yet, beneath the sophisticated algorithms lies a critical, often unsung, physical. Operating at the physical layer of the OSI model, optical modules are core devices in optical. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a.

Data Processing Process of Optical Module
