

How to connect the network patch panel wires

Overview

To wire a patch panel: Mount the panel in your rack, route cable runs to the back with service loops, strip 2-3 inches of jacket, match each wire to the T568B color code printed on the panel, seat the wires into the 110 IDC slots, and punch down with a 110 tool. The complete process for terminating cable runs at a patch panel, from mounting and cable management to punch-down, labeling, and testing every port. Patch panels are one of the best ways to manage an expansive local area network (LAN) by providing quick and easy access to the ports and connections that connect them altogether. They come in a range of sizes, and are typically mountable, whether that's on a wall, or on a rack to make for easier.
