

How to wire the dual-optical module of the switch

Overview

Most modern fiber-enabled network switches require an SFP transceiver module featuring a duplex (two strand) multimode OM3 or duplex single mode OS2 connection with LC connectors. In this article, we'll explain how to connect multiple Ethernet switches using fiber optic cables and the equipment required for this to work. Network topology refers to the way in which the links and nodes of a network are arranged in relation to each other. Operating the FOS unit requires setting its operating mode with the two switches on the unit's front panel to the appropriate positions (see Figure 3). Small Form-factor Pluggable modules (SFP module) are the workhorses of modern network connectivity, enabling flexible fiber optic or copper links between switches, routers, firewalls, and servers. Whether you're upgrading bandwidth, replacing a faulty unit, or reconfiguring your topology, knowing. As a key component in CWDM system, CWDM Mux Demux enables the coupling and separation of optical signals.

How to wire the dual-optical module of the switch

Installing SFP+ transceivers and connecting cables

If the switch is shipped without SFP+ transceivers already installed, complete these steps to first install the transceivers and then to connect the cables.
