

# **Huawei switch interface light reception check**

## Overview

---

Run the following command to view interface information: `display interface <interface-type> <interface-number>` The output includes interface rate, module type, link status (the state being UP is a prerequisite for normal operation) and traffic statistics, which can be used for. This document describes how to check the switch interface or port status and how to locate an interface physically down fault and restore the interface to the up state.

**Problem:** All optical ports cannot be connected, and the indicator lights are not on.

**Solution:** To solve this problem, you can follow these steps: Check if the fiber and optical modules are compatible. The method for starting and stopping viewing logs on a Huawei backbone switch depends on the specific switch model and software version.
