

Long-distance optical cable well

Overview

Here we outline some new technologies in this context within case studies from different research projects including permanent installation of fiber-optic sensor cables behind casing, monitoring of high-temperature wells, a hybrid wireline logging system, and seismic. Permanent downhole fiber-optic cables are critical infrastructure in wellbore monitoring systems, ensuring reliable transmission of data for applications such as distributed temperature, acoustic, and strain sensing (DTS, DAS, and DSS)—all with one 1/4-in control line. These include several distributed methods, where data is recorded with high spatial and temporal resolution over long distances using the optical fiber as a sensor, exploiting different scattering mechanisms. With amplifiers, such as Erbium-doped fiber amplifiers (EDFAs), the distance can be extended to 600 miles or more, and even further with additional amplifiers for long-haul applications. The reach of multimode fiber, which has a larger core diameter and supports multiple modes of light propagation. Our Long-Reach Technology offers a streamlined architecture that can adapt to future needs and grow. Unlike traditional copper cables that rely on electrical signals, optical cables transmit. In the demonstration experiment, we demonstrated a high-capacity transmission of 455 terabits per second over a transmission distance of 53.
