

Methods for processing beam splitters

Overview

A beam splitter or beamsplitter is an that splits a beam of into a transmitted and a reflected beam. It is a crucial part of many optical experimental and measurement systems, such as, also finding widespread application in. This paper reviews the on-chip beam splitting methods in recent years, which are mainly divided into the following categories: y-branch, multimode interference coupling, directional coupling, and inverse design. The library includes research papers, conference proceedings, technical articles, and book chapters that cover both theoretical and.
