

Network Optical Interface Module

Overview

An optical transceiver module, often simply called an optical module, acts as a signal conversion interface in fiber optic networks. It transforms high volumes of electrical signals into optical signals for transmission over fiber cables, or reverses the process at the receiving. 8Tbps of bandwidth using 64 electrical lanes and incorporates an integrated liquid-cooled cold plate capable of supporting 400W+ module power. Scale AI back-end and front-end networks with high-performance, reliable 400G to 1. Accelerate your migration to 100G and 400G and maximize the port use on switches and routers with Cisco optics that are rigorously tested, qualified.
