

OPW optical cable splicing

Overview

To effectively splice OPGW cables, begin by ensuring site safety through the establishment of an equal potential zone, then prepare and straighten the cable, remove the armor to access the fibers, splice the fibers using a fusion splicer, and secure the splice with a heat shrink. OPGW cables combine the functions of grounding and communication, with optical fibers in the middle of the conductive cable. OPGW cables are installed on transmission and distribution power lines, above the high-voltage power conductors since they act as protection from lightning strikes. Optical fibers as a medium have many great features, but handling fiber-optic cables requires trained and experienced staff.

OPW optical cable splicing

Requirements For Fusion Splicing Of OPGW Cables

It is advisable for skilled operators to use manual cutters for rapid optical cable splicing or rescue at room temperature; on the contrary, it is better
