

Optical power meter tests optical module optical attenuation

Overview

An optical power meter displays two key test parameters that allow fiber design specifications like insertion loss or low attenuation to be evaluated. The first is the wavelength setting in nanometers (nm) and the second is the power level in (dB or dBm). To test transmitted power in sfp optical modules, you use an optical power meter to get exact results. Keysight optical power meters measure optical signal strength, providing multi-channel measurement processing and system control while offering rapid response times, wide dynamic range, and simple integration into automated test setups. Accurately testing an optical Transceiver means proving two things: that the module is emitting the right power at the right wavelength, and that the link it's attached to delivers that signal without unexpected loss or reflections.

Optical power meter tests optical module optical attenuation

How to Test a Transceiver with an Optical Power Meter

This guide walks a practical, field-ready workflow and explains the settings and test artifacts technicians routinely check.
