Peru replaces electrical distribution boxes

Overview

The Minem says Peru wants to modernise its electrical distribution system, migrating from the traditional one to one that uses technologies that allows the incorporation of non-conventional renewable energies such as those from the sun and the air. The European Investment Bank is expected to contribute an additional \$125 million to the project. The 544 km extra-high voltage line between the two countries will help improve energy security. On behalf of German international cooperation for development in a project implemented by GIZ, NIRAS has been working closely with three utility companies to support the elaboration of smart-grid roadmaps, forward-thinking business plans, and the execution of innovative pilot projects. In partnership with Electroperú, UNOPS will support the modernization of the Mantaro Hydroelectric Complex – Peru's largest energy generation facility – strengthening energy security for more than 4. The previous edition of the Decarbonisation Quarterly (2025 Q1), featured an insight on the evolution of the electricity grid in Peru.
