

Remote monitoring telecom site power supply system for campus network applications

Overview

This research paper presents a comprehensive study on the development of an IoT-enabled remote monitoring system for telecom SMPS (Switched-Mode Power Supply). Remote power monitoring gives you visibility into exactly what's happening at every site, continuously, so you can respond before a problem becomes an outage. Modern open-source tools for remote monitoring and control offer new methods of managing telecom power, security, and environmental infrastructure. As SiteBoss products have evolved from doing simple alarming, the new emphasis is to provide more abilities to do automation and control of power. Both remote transmission sites and town centre exchange nodes require secure power and monitoring to operate reliably whilst co-location infrastructure needs to be monetised through consumption allocation.
