

# Rof optical module

## Overview

---

Radio over fiber (RoF) is an analog transmission method that uses RF signals to modulate light, which is then transmitted through optical fibers. RoF technology has been widely used in avionics, distributed antennas, cellular telephones, satellite communications, and other fields. For over 30 years, MACOM has developed and manufactured the fastest, most sensitive and broadest wavelength photoreceivers available. These modules combine the functionality of both a transmitter and a receiver into a single unit, enabling bidirectional communication.
