

Spectrum Spectrometer Sensor

Overview

Spectral sensors, also called spectrometers are instruments that are used in spectroscopy to study light. Spectral sensors capture and measure the light reflected or emitted by an object or scene in the form of a reflectance spectrum. The "Triad" Architecture: It uses three specialized sensors, the AS72651 (UV), AS72652 (Visible), and AS72653 (NIR), each working. What are typical applications for UV-Vis spectroscopy?

Typical applications include white light interference for thin film analysis, UV absorption of proteins for quantitative analysis.
