

Switch port 5 has no light display

Overview

Verify that the transceiver is installed correctly and that the cable is connected correctly. System activity and status can be determined through the activity of the LEDs on the switch. Sometimes, you might find that only the power light is lit on your unmanaged switch when a DUT (device under test like a computer or a router) is connected to the switch, this problem might be caused by non-standard cable, the speed negotiation failure between the switch and the DUT, or the switch.
