

What is a light-sensing time-delay module

Overview

A time delay is a countdown timer that activates only after the sensor stops detecting motion. The LDR light sensor is very affordable, but it requires a resistor for wiring, which can make the setup more complex. Hysteresis can be accomplished with a comparator or op amp circuit (easily googled), and the timer can be done with simple 555 "one shot" circuit that is reset by the sensor. However, for this automation to be truly effective and efficient in diverse environments, a one-size-fits-all approach fails. The HC-SR501 PIR (Passive Infrared) sensor is one of the most widely used motion detection modules in the Arduino and DIY electronics community. Whether you are building a smart home security system, an automatic lighting controller, or a visitor counter, the HC-SR501 offers an affordable and.
