Will two light-emitting modules lit up when connected together

Overview

In a multiple LED circuit, several LEDs are connected in parallel or in series, depending on the desired configuration and application. This allows for the simultaneous operation of multiple LEDs, creating different lighting effects or ensuring redundancy in case one. Again, don't worry, here we will see how to wire a parallel LED circuit and that should help tie the ideas together. In a parallel circuit all the positive connections are tied together and back to the positive output of the LED driver and all the negative connections are tied together and back to. LEDs (Light Emitting Diodes) are electronic components that emit light when an electrical current is applied to them. These two items have excellent price/quality ratio : Let's start by talking about forward voltage and forward current, these are two basic parameters that you need to know. I remember that Snapcircuits are some sort of prefabricated modules that can be attached to work together and are supposed to be beginner-friendly, but they will most likely have some extra components that might be important for a good answer to this question.

Will two light-emitting modules lit up when connected together

What is LED Modules?

An LED module is a self-contained lighting unit that integrates multiple light-emitting diodes (LEDs) onto a single printed circuit board (PCB) or substrate. LED
