

# **Yellow tail fiber composition**

## Overview

---

The main chemical components are cellulose, semi-cellulose, lignin, pectin, and water-soluble matter etc. ) are naturally occurring aquatic macrophytes with significant industrial potential because of their abundance, high-quality fibers, and high fiber yields. This study is the first attempt to investigate how phenological development and plant maturity impact the quality. Description: An investigation was carried out to determine the feasibility of multiple harvest times of *Typha Latifolia* plants by analyzing the morphological developments such as calcium oxalate plates, fibre diameter and chemical composition using Environmental Scanning Electron Microscope (ESEM). As a source of natural plant fiber, cat-tail leaves have the advantages of a wide range of resources, being renewable and recyclable.
